

Bedder/Mulch Layers - Combination Units

COMBI-SUPERBEDDER

**BP480 with optional 55635
single wheel drip tape layer**

Our combi-superbedder is the ultimate combination machine and is unmatched by any other product on the market. It consists of our standard superbetter frame with a 1300 lb fertilizer distributor, and a high speed plastic mulch layer behind.

With a combi-superbedder, you can pull and shape a solid planting bed, apply dry fertilizer (or a liquid fertilizer solution with optional accessories), and lay plastic mulch on the bed at the same time.

With optional equipment, you can lay drip irrigation tape and fumigate the bed while you are shaping it and covering it with mulch.

No other machine is capable of doing all of these functions at once. Imagine making one pass through the field to shape your bed, fumigate, fertilize, lay drip tape, and lay plastic mulch!

Part #	Description
BP480	Combi-superbedder-mulch layer, 1300 lb (591 kg) hopper, without press pan, custom row centers

A three-point Category II hitch is standard. Call our sales department for weights and dimensions and for recommendations on accessories. It is the customer's responsibility to determine tractor horsepower requirements. Customized row center sizes are available upon request from our sales department.

STABILIZATION COULTERS

It is very important to make sure that your plastic mulch layer follows the tractor in a straight line. This is difficult in fields where you are riding the side slope of a hill.

We provide stabilization coulters that mount to the side frame of a high speed mulch layer. They consist of a mounting bracket and a straight disk. Once the disk is set into the soil it makes it difficult for the machine to slide sideways.
