

Sprayers - Related Equipment

SELF PROPELLED SPRAYER

High clearance sprayers are used by many growers who do not use drive rows or trench irrigation in their production method. When producing tall growing crops, or using stake production, a high clearance sprayer is necessary to spray these crops.

We custom build high clearance sprayer for our customers. If a customer can provide an older tractor, we will "lift" it to provide a clearance of 5 ft (1.5 m) and add a spray platform. By adding our standard spray booms and plumbing, we produce a self-propelled, high-clearance sprayer. By converting a piece of equipment that was, in most cases, not being used on the farm, the grower can pick up a new piece of equipment at a significantly lower price than if he were to purchase a new sprayer.

Contact our sales department directly to discuss your interest in converting a tractor into a high clearance sprayer.

NURSE TANK

We have made a variety of nurse tanks and water wagons for our customers. Because our sprayers usually hold over 1,000 gallons (3,790 L), our nurse tanks are typically 3,600 gallons (13,644 L) to efficiently bring water to the field.

Our fiberglass tanks have the strength necessary for a tank this size, and fiberglass construction minimizes algae growth while the tank is holding water. We make them large and durable. Call our sales department to discuss size options.

DECONTAMINATION STATION

Our decontamination station is a tool designed to help you keep workers safe and comfortable in the field. It includes a 300 gallon fresh water tank, a stainless steel sink and faucet for washing, a self-contained eyewash station, a weather-tight storage cabinet, and an emergency full body wash station. It can be towed behind any tractor, pickup truck, or vehicle for movement from field to field. Customization options are available.
